Magnetics on Hovering AUVs – A New Tool for Target Point Investigation

HELMHOLTZ
RESEARCH FOR GRAND CHALLENGES

GEOMAR 

1) What we **do not** want:

- Map large areas as fast as possible

2) What we **do** want:

- Individually investigate potential targets with magnetic sensors

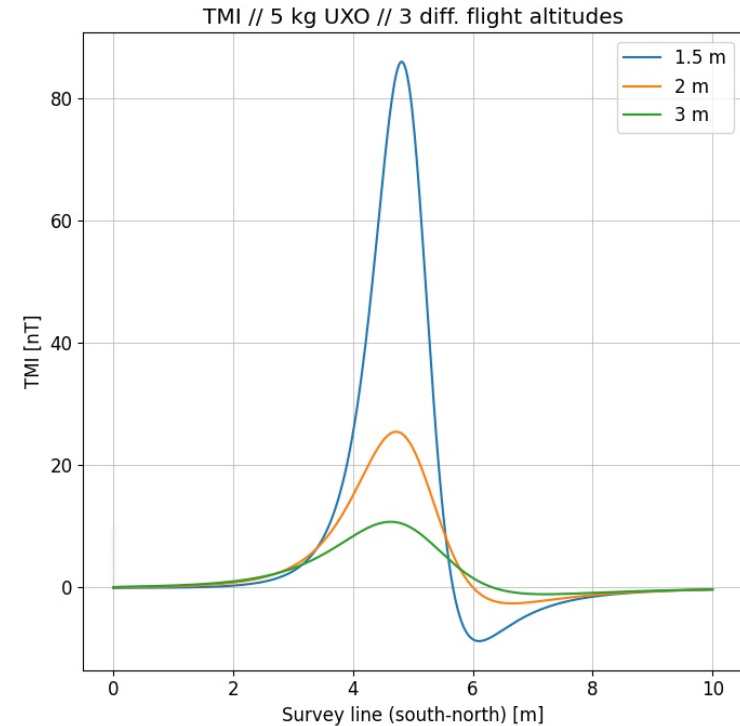

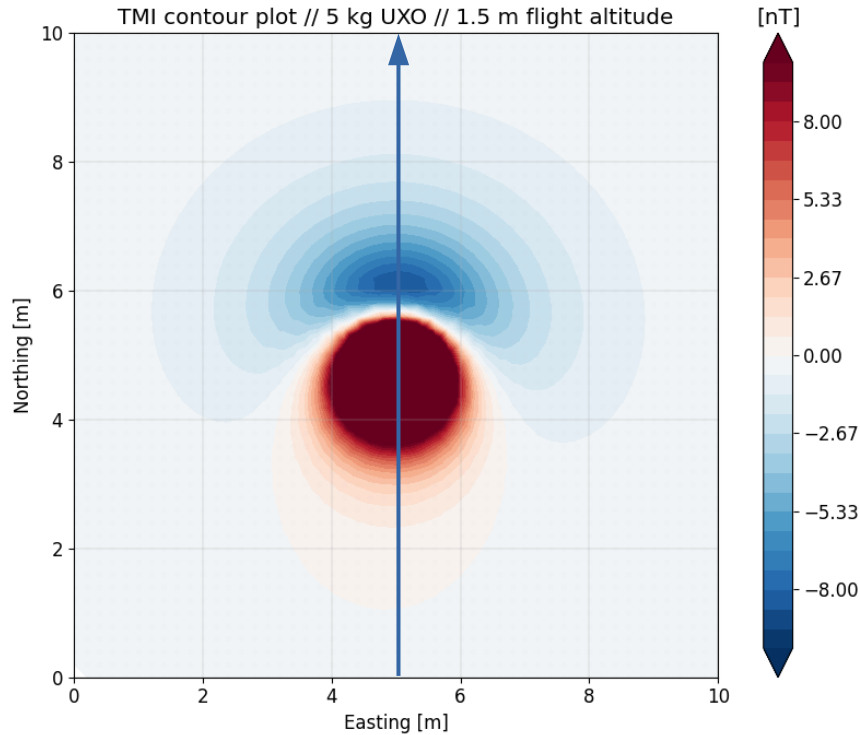

3) Challenges

- Noise (AUV Thrusters, other devices, → Distance)
- Navigation (Control unit, water currents)

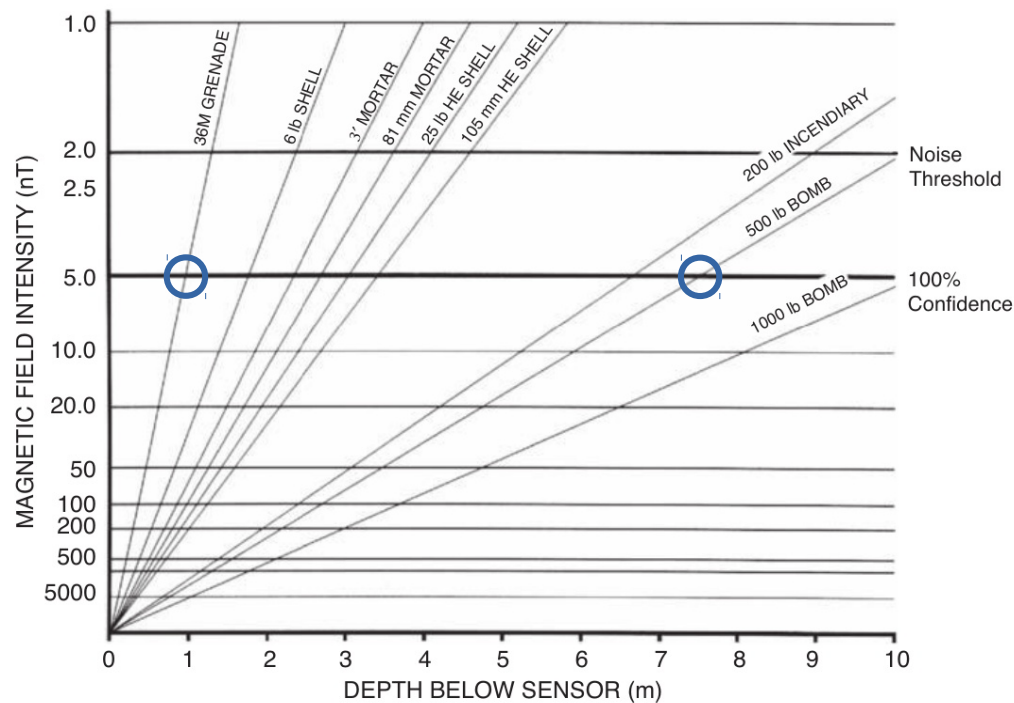

■ Outline

- Magnetic signatures of ferrous UXOs
- Introduce AUV / Sensor construction
- Magnetic noise & Sensitivity
- 1D & 2D results

Magnetic Patterns of UXOs (synthetic data for a 5 kg point mass)

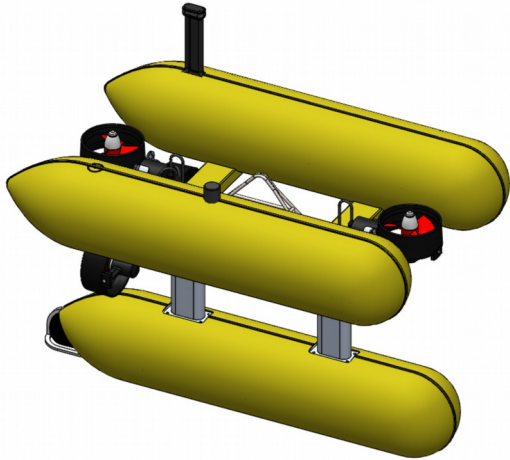

Magnetics: Typical UXO Amplitudes

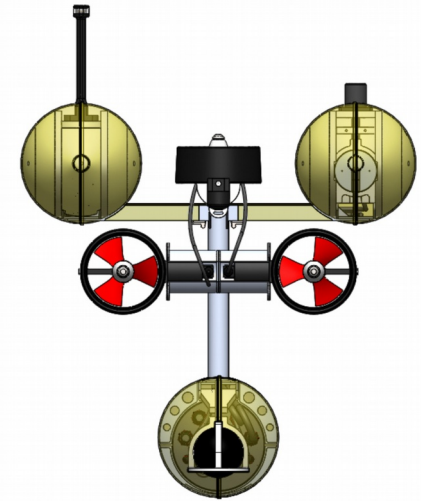

[Reynolds, 2011]

Girona 500 - Hovering AUVs (Anton & Luise)

- Size: 1 x 1 x 1.5 m³
- Weight in air: from 140 kg
- Maximum depth: 500 m
- Propulsion system: 5 thrusters
- Endurance: up to 8 hours
- Maximum Velocity: 1.0 m/s (0.4)
- Minimum Altitude: 1 m
- Open Software Architecture (Based on ROS)
- Hover-able
- Additional devices: DVL, INS, USBL, WiFi, GPS, CTD
- 12.3 MP Camera with 8 high power LEDs (ground-truthing)

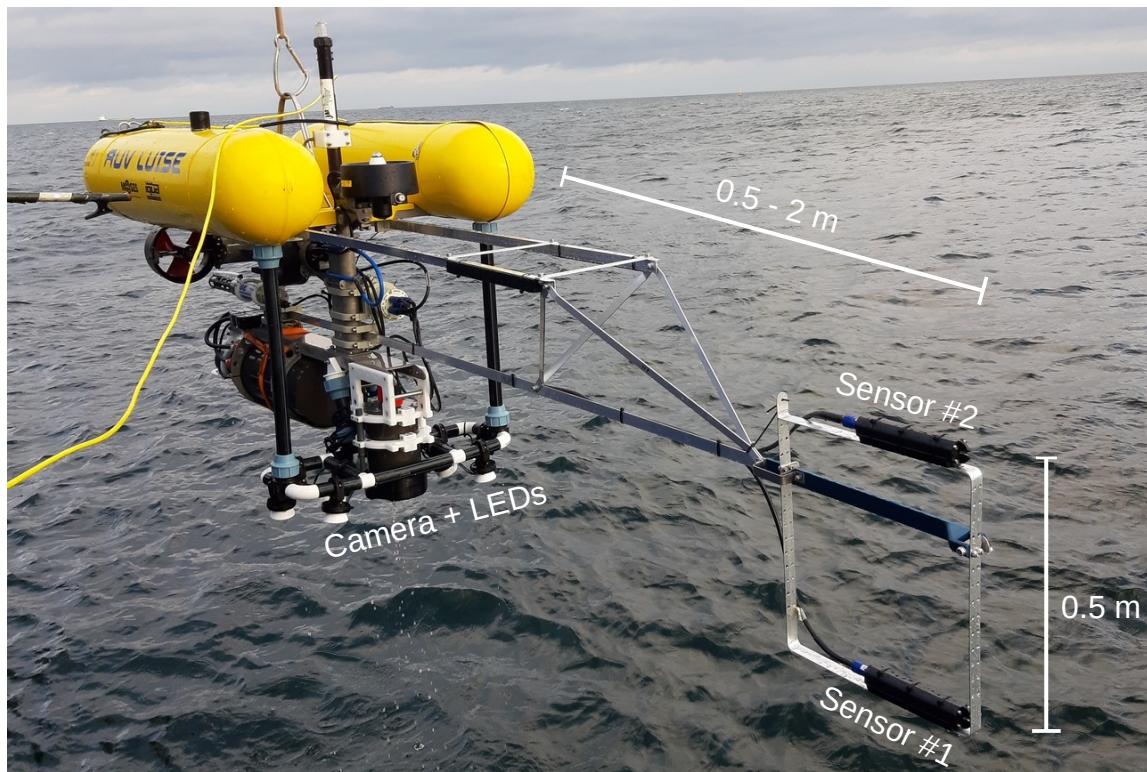

Submersible Magnetometers

GEOMAR

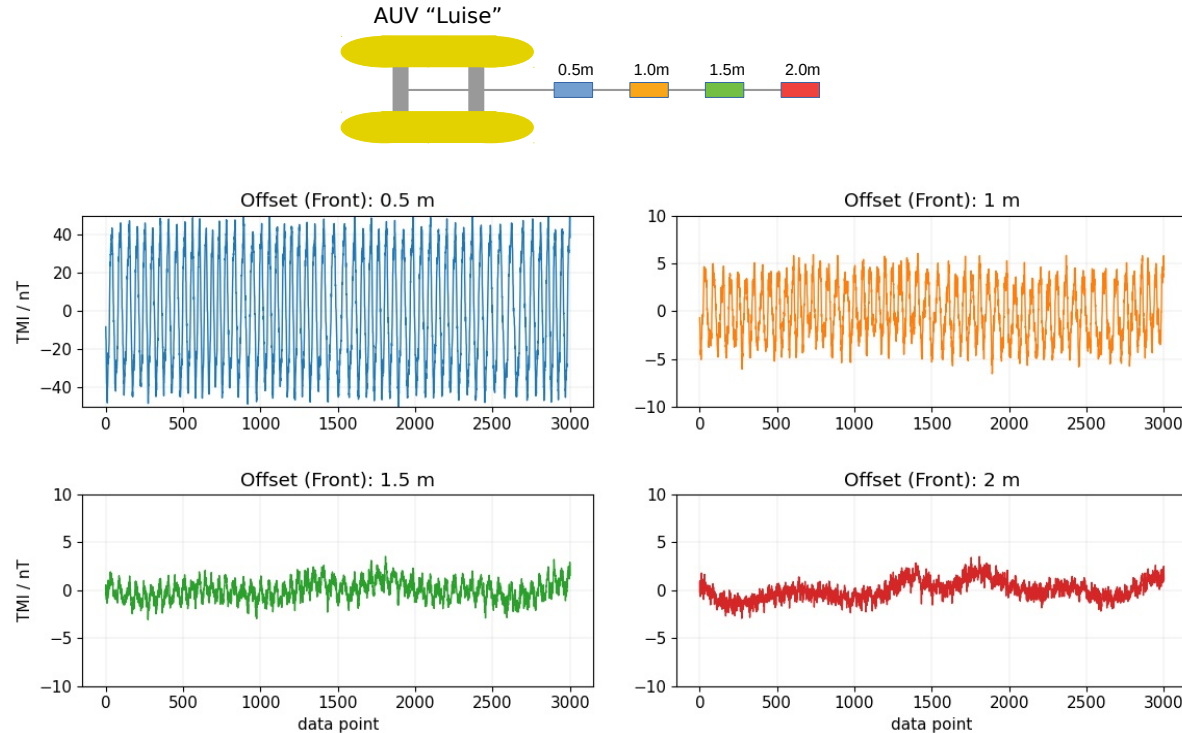

[SENSYS GmbH]

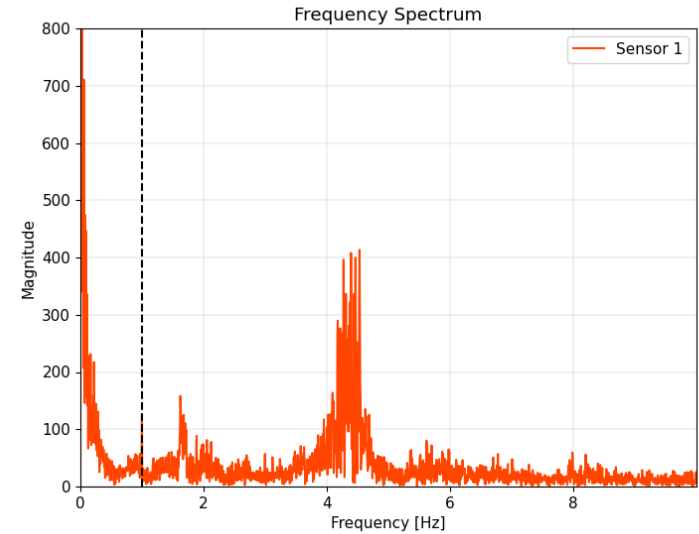

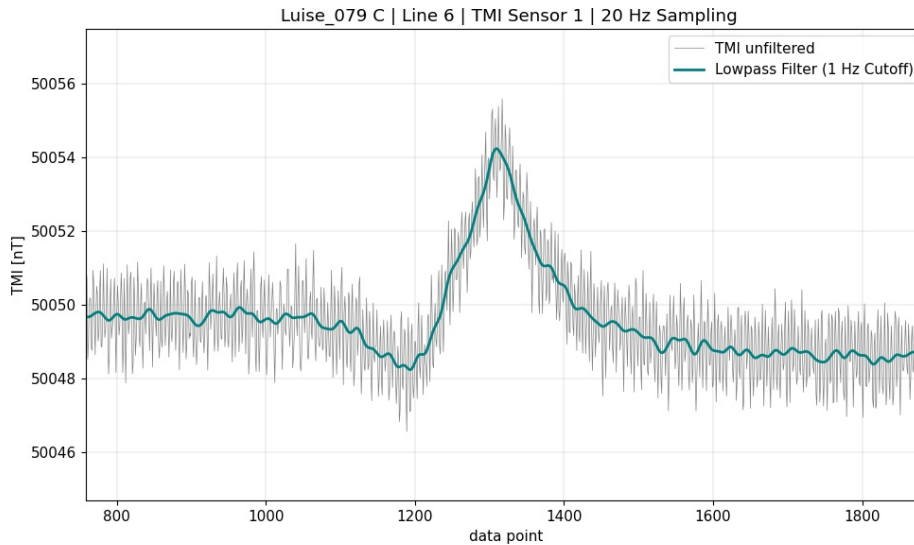

- Two Sensys 3-axis Fluxgate Magnetometers (FGM3D UW)
- Vertical Gradiometer (0.5 m)
- Data Acquisition Unit (DAU)
- Depth rating: 300 m
- Sampling rates: 200 Hz · 10 kHz

Noise Levels – Depending on Distance

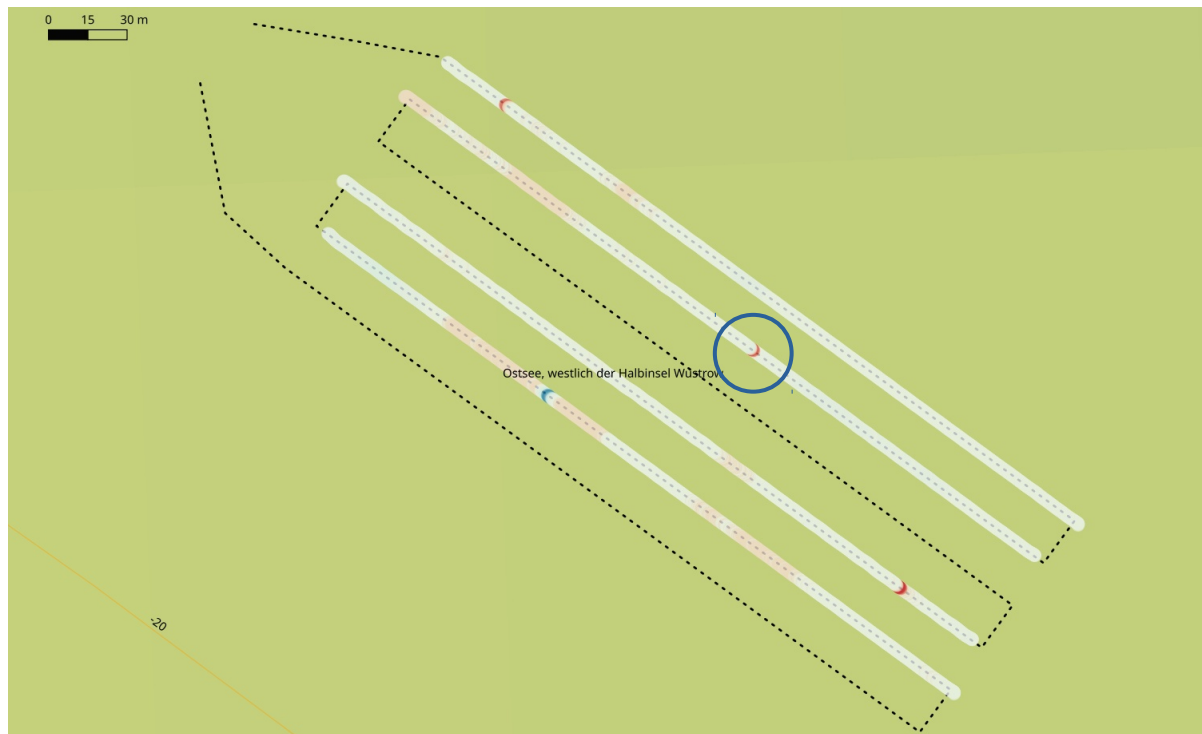

Field Data: Noise / Sensitivity

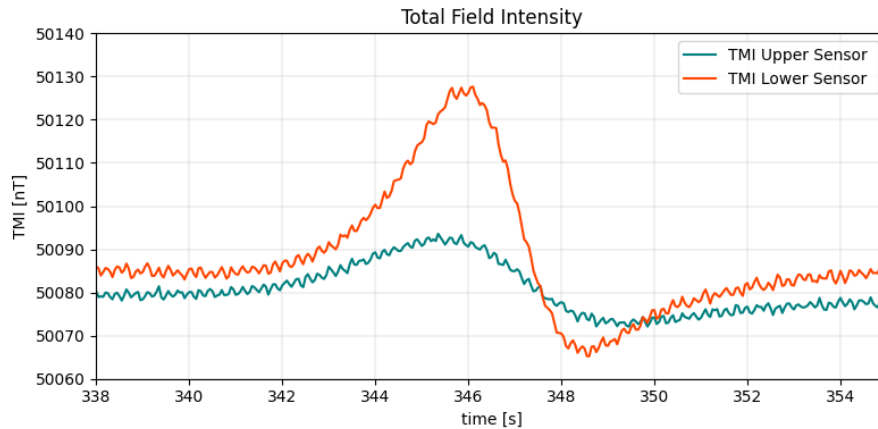

→ Potential sensitivity: Only a few nT!

1D Field Data: Trollegrund

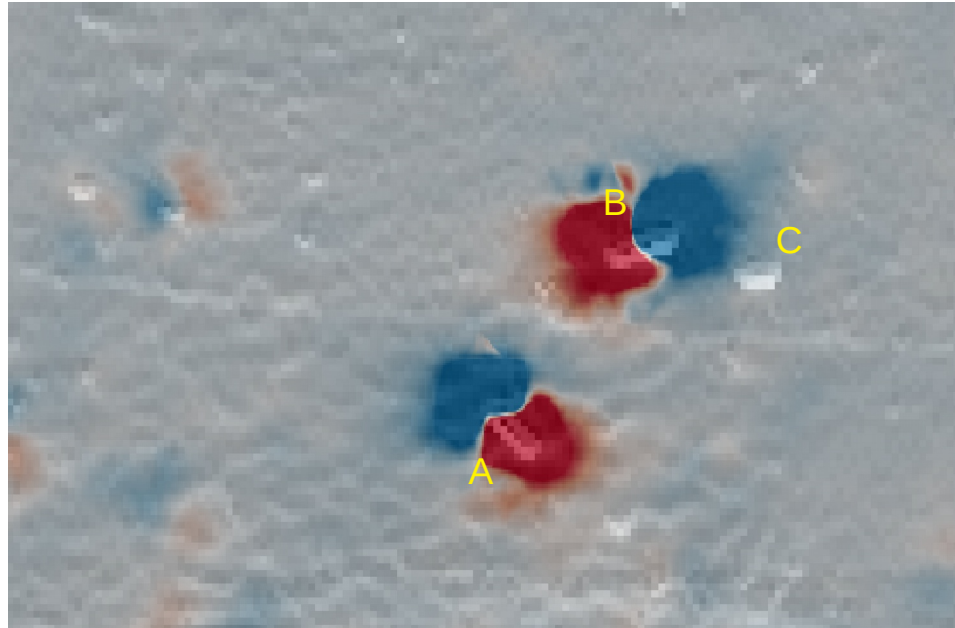

- Trollegrund:
Between Wismar and Rostock
- 3 km from the shore
- Test mission (no target investigation)
- 6 lines: 300 m
- 1.2 m altitude
- 0.4 m/s velocity
- 4 anomalies detected!

1D Field Data: Trollegrund

10.5 or 12.8 cm Flak grenade (13 or 22 kg metal)

2D Field Data: Kolberger Heide

(Dimensions: 35 x 20 m², Flight altitude: 1.2 m, Velocity: 0.4 m/s, Line Spacing: 1 m)

Conclusions & Outlook

- Conclusions:
 - Successfully installed magnetometers on an AUV
 - Sensitivity of “a few” nT
 - Supporting camera images
- Outlook:
 - Automated search for UXO patterns in the recorded magnetic data
 - Develop a “backseat driver” to automatically control the AUV based on in-situ measurements
